Application for AI Developer (LLM Products) - Remote

Dear dexter health team,

I am writing to apply for the AI Developer (LLM Products) position at dexter health. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently an LLM-based pipeline that turns complex regulatory and technical documents into structured data that domain experts validate.

At Kniit, an early-stage startup, I am the only developer on that pipeline and report to the CTO. I built it with LangGraph as a set of agents for entity extraction, relationship analysis, consolidation and reflection, all working on documents from the German energy sector. I measured it against ground truth taken from SAP systems, and that is what let me improve it step by step: precision and recall went from 33% and 45% to 93% and 90%. For a second, high-volume source I found that plain code did the job better than a model. Switching that stream to a deterministic pipeline cut a projected $200,000 LLM budget to almost nothing and pushed accuracy toward 100%.

The SAP domain experts also needed a way to check the results, so I built Expert Interface, a React and Python app on Azure where they validate and approve knowledge-graph changes. Before that, at Covestro, I took an agentic LangGraph application from idea to deployment, with a React frontend, a FastAPI backend, Docker, AWS CDK and GitLab CI/CD, and automated the evaluation of our RAG system with RAGAS and PytrecEval against answers written by chemists.

Claude Code is a standard part of how I work. I write my own skills for it, use it to build and debug, and at Kniit I built an MCP service that gives it millisecond-latency access to our knowledge graph.

Your product is very close to the problem I have been working on. A nurse dictates at the bedside, dexter drafts the entry, the nurse checks it, and only then does it go into Vivendi, Senso or whichever system the home already uses. Getting that draft right, in the right structure for each system and for every accent and speaking style on a care team, is the hard engineering part, and you measure the result in time given back to carers: about 20 minutes less documentation per person per day. I have not worked in care yet, but I know what it takes to make AI output reliable enough for domain experts to review and approve it, and I would like to do that for people who should be spending their time with residents.

I will work remotely from Germany, hold an EU Blue Card and can start on 15 November 2026. My German is at B1 level and I am improving it. Thank you for considering my application. I would be glad to talk about how I could help.

Kind regards,

Chandu Prasad Bhairapu
