Application for Product Engineer (m/f/d)

Dear Hiring Team,

I am writing to apply for the Product Engineer position with your client, the Berlin start-up using AI to change how medical and clinical information reaches healthcare professionals and patients. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently as the sole developer of a knowledge-extraction system at a small start-up, where I build both the AI pipeline and the web app that domain experts work in.

At Kniit, a start-up building for the German energy sector, I report directly to the CTO. One of the things I built there is Expert Interface, a web application with a React frontend and Python microservices, deployed on Azure. Our extraction system produces a knowledge graph, and that graph is only useful if SAP experts can check it, so the app gives them a workflow to validate and approve changes to it.

I also let measurements decide what to work on next. I tested our LangGraph multi-agent extraction against ground truth taken from SAP systems and kept refining the agents until precision and recall went from 33% and 45% to 93% and 90%. For a second, high-volume data source I chose not to use an LLM at all: a deterministic, code-based pipeline cut a projected $200,000 LLM budget to near-zero recurring cost.

Understanding the user's workflow before writing code is something I learned at Covestro. As an AI consulting intern I worked with business stakeholders to understand how they make decisions, advised them where agentic AI could help, and then built it as a full-stack application: React frontend, FastAPI backend, containerized with Docker and deployed to AWS with CDK and GitLab CI/CD. Earlier, as a data science intern, I built a Streamlit dashboard that let chemists try parameter changes and see predicted outcomes before running a physical batch.

Medical information is a field where an unclear answer has a real cost, and where the same fact has to read differently for a doctor and for a patient. That is a product problem as much as a model problem, and it is the kind I want to work on. The role also asks engineers to have a say in what gets built and to work closely with the founders, which is close to how I work today, reporting directly to the CTO in a small team.

I am based in Berlin and the hybrid setup suits me. I hold an EU Blue Card and can start on 15 November 2026. Thank you for considering my application. I would be glad to talk through the role and how my work would fit the team.

Kind regards,

Chandu Prasad Bhairapu
