Application: AI Associate

Dear Ms Kutschera-Gross,

I am writing to apply for the AI Associate position at BCG Platinion. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and for the past year I have built them together with AI coding agents such as Claude Code.

At Kniit GmbH I am the only developer on an agentic knowledge-extraction pipeline for the German energy sector. I designed the orchestration in LangGraph, with entity, relationship, consolidation and reflection agents running in parallel, and built a Model Context Protocol service that gives Claude Code direct access to our knowledge graph. I work in Claude Code with custom skills I wrote, so I know first-hand that a coding agent is only as good as the rules, context and tests you give it. I report directly to the CTO and explain my design choices to SAP domain experts.

I don't trust an agent's output until I have measured it. I evaluated the Kniit pipeline against ground truth taken from SAP systems and raised precision and recall from 33% and 45% to 93% and 90%. Not every problem needs an agent, either: for a second, high-volume data source I built a deterministic pipeline instead, which brought a projected $200,000 LLM budget down to almost no running cost. My Master's thesis at Covestro was an automated evaluation framework for RAG systems, using RAGAS and PytrecEval against answers written by chemists.

On the delivery side, I built an agentic LangGraph application at Covestro with a FastAPI backend and React front end, containerized it with Docker and deployed it to AWS with CDK through a GitLab CI/CD pipeline. Much of my work has been turning what domain experts know into something a system can check. At Kniit I worked with SAP domain experts and built a web app where they validate and approve knowledge-graph changes themselves. I haven't used Langfuse or LangSmith yet; so far my evaluation has been built into the pipelines themselves.

Your Agentic Software Factory article puts it as "Humans govern outcomes, agents do the work". That governing part is what I want to work on: specs that agents can execute, CI gates they have to pass, and evaluation that tells a client whether the speed-up is real. Doing that across many client landscapes, often starting with legacy migration as your article suggests, is something I could not learn in a single product team.

I live in Essen, hold an EU Blue Card and can start on 15 November 2026. I am happy to move to Berlin and to travel to client sites. My English is business fluent and my German is at B1 level.

Thank you for considering my application. I would be glad to walk you through the Kniit pipeline and how I measured it.

Kind regards,

Chandu Prasad Bhairapu
