Application for Backend Software Engineer - AI Systems

Dear HAIAR Team,

I am writing to apply for the Backend Software Engineer - AI Systems position at HAIAR GmbH. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and for the last year I have been the person responsible for an AI knowledge-extraction pipeline from the first ingested document to the final answer.

At Kniit, an early-stage startup working for the German energy sector, I am the sole developer of the knowledge-extraction pipeline and report directly to the CTO. I built every stage myself: ingestion, chunking, prompt engineering, indexing and retrieval. The core is a multi-agent workflow in LangGraph where extraction, relationship analysis, consolidation and reflection agents run in parallel. I measured every version against ground truth derived from SAP systems, and over the project precision and recall went from 33%/45% to 93%/90%.

Your posting asks for someone who weighs quality against latency and cost. My clearest example of that: for a second, high-volume data source the projected LLM budget was $200,000. I built a deterministic, code-based pipeline instead, which brought the recurring cost close to zero and pushed extraction accuracy toward 100%. I also built an MCP query service that serves the knowledge graph with millisecond latency, and a curation app (Python microservices on Azure) where domain experts validate and approve the extracted knowledge-graph changes.

RAG is also what I studied in depth. For my Master's thesis at Covestro I benchmarked multilingual embedding models on more than one million chunks of internal data and automated retrieval and generation evaluation with RAGAS and PytrecEval, running on AWS Lambda, SQS and DynamoDB. Before that I shipped an agentic LangGraph application there with a FastAPI backend, Docker, AWS CDK and GitLab CI/CD. So checking whether answers stay grounded in the retrieved sources is work I have done hands-on.

CARvinci promises dealerships that it works without interfaces or an IT project, on German servers. That promise puts the hard work in the backend: documents and data have to be ingested reliably, answers have to stay grounded, and nothing can leave the GDPR (DSGVO) boundary. I would like to own that part of a product that more than 30 dealerships helped shape and that is built for people in service and sales.

I live in Essen, hold an EU Blue Card and can start on 15 November 2026. Remote work suits me, and Münster is close for team meetings. My German is at B1 level. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
