Application for Agentic-AI Harness Engineer

Dear Hiring Team,

I am writing to apply for the Agentic-AI Harness Engineer position at kausable. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently as the only developer turning language models into a multi-agent knowledge-extraction system for the German energy sector.

At Kniit I owned that system from raw documents to production and reported to the CTO. Four LangGraph agents run in parallel for entity extraction, relationship analysis, consolidation and reflection, and much of the work was what sits around the models: ingestion, chunking, the prompts and context each agent sees, and how agentic, deterministic and monolithic indexing strategies compare. Measured against a ground truth taken from SAP data, precision and recall rose from 33% and 45% to 93% and 90%.

I also learned when not to use a model. For a second, high-volume source I replaced the LLM calls with deterministic code, which cut a projected $200,000 LLM budget to almost nothing and made the output more reliable. To make the knowledge graph usable by other developers I built an MCP query service that Claude Code calls with millisecond latency, and a React and Python app on Azure where experts validate and approve knowledge-graph changes.

Evaluation was also the core of my Master's thesis. At Covestro I automated RAG evaluation with RAGAS and PytrecEval against answers written by chemists, and benchmarked multilingual embedding models on over a million chunks of internal data, using PyTorch and Hugging Face. Before that I deployed a LangGraph agent at Covestro with FastAPI and Docker on AWS via CDK. I have not worked with PFNs yet; the idea of a model that learns a system from a handful of examples is the reason this role stands out to me.

You are a small team out of Heidelberg's physics department, with a fresh seed round and a model that adapts without retraining. TipPFN shows what the core model can do; the harness decides whether customers can depend on it, and that is the part I want to build. I have done that alone at an early-stage startup, and I would like to do it next to researchers.

I will be based in Heidelberg, hold an EU Blue Card and can start on 15 November 2026. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
