Product Engineer: two honest answers

Dear Max,

I am writing to apply for the Product Engineer position at RIZM. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications; for the last year I have been the sole developer of an agentic knowledge-extraction system for the German energy sector at Kniit, which is why RIZMO caught my eye. You asked for a few honest lines instead of a classic letter, so here are my answers.

One weekend, Claude Code, unlimited tokens: what do I build? A replay bench for an energy agent. I would take a simulated site with a year of 15-minute load, PV and day-ahead prices, freeze the agent's decisions day by day, and score them against the plan a solver would have picked with hindsight: cost, constraint violations and how often the explanation cites a number that is not in the tool output. I would build it because measurement is what made my own agents better: at Kniit the extraction agents were scored against a ground truth derived from SAP data, which is how I could show precision moving from 33% to 93%. With unlimited tokens the temptation is to build a bigger agent. I would rather build the thing that tells you whether the agent got better.

Which new skill would I give RIZMO tomorrow, and what is the bottleneck? Reading the rules. Grid fees, levies and network operator conditions change, and they sit in long German PDFs. A skill that extracts the tariff components that apply to a site and turns them into parameters for the optimiser would let RIZMO explain why a plan changed when a regulation did. I have built something close to the extraction half: LangGraph agents for entity extraction, relationship analysis, consolidation and reflection over regulatory energy documents, plus a deterministic pipeline where an LLM was too expensive (it cut a projected $200,000 LLM budget to near zero). The bottleneck is not the model. It is a trustworthy ground truth per operator and a review step where an energy manager confirms a parameter before it reaches the optimiser. At Kniit I built that kind of review step: Expert Interface, a React and Python app where domain experts validate and approve knowledge-graph changes.

To be direct about the stack: at work my frontends were React and my backends Python. I have not used TypeScript, Vue or Node in a job yet, so I would still be learning them on your product, with Claude Code, which I use daily with custom skills and agentic coding workflows.

I am based in Munich, am happy to travel to customer sites, hold an EU Blue Card and can start on 15 November 2026. My German is at B1 level. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
