Application for Machine Learning Engineer (w/m/d)

Dear Hiring Team,

I am writing to apply for the Machine Learning Engineer position at WetterOnline. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most of it in Python with PyTorch, and I would like to put that into models for your weather data.

At Covestro I designed and trained Random Forest, XGBoost and LSTM models on large volumes of sensor time series. I built lag features and rolling windows with NumPy and Pandas, and benchmarked the models against the empirical curve-fitting the chemists were using. Earlier, at Cognizant, I developed ARIMA, SARIMA, Prophet and LSTM models for EV load forecasting. That work was about modelling a physical process from data, which is the part of your posting I find most interesting.

On the engineering side, I used PyTorch and Hugging Face models for my Master's thesis at Covestro, where I benchmarked multilingual embedding models on more than one million text chunks. At Kniit I was the sole developer of a knowledge-extraction pipeline and raised its precision/recall from 33%/45% to 93%/90%. I work with Git and GitLab. I should say plainly that my computer vision experience comes from coursework (CNN and ResNet image classification) rather than from a job, and that I have not yet worked with OpenCV, C++ or OpenMP. I learn new stacks quickly and like being close to the code.

WetterOnline appeals to me because the work is concrete: neural networks that make radar and satellite data easier to read, built in a company of about 160 people where development, product and marketing work together. That mix of research-style modelling and a visible result is what I am looking for.

I am based in Bonn, hold an EU Blue Card, and can start on 15 November 2026. Thank you for considering my application. I would be glad to talk about how I could contribute.

Kind regards,

Chandu Prasad Bhairapu
