Application for Founding Engineer

Dear Hiring Team,

I am writing to apply for the Founding Engineer position at GlassFlow. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently as the sole developer of an agentic system in an early-stage startup.

At Kniit I owned the knowledge-extraction pipeline for the German energy sector from ingestion to indexing. Source documents went in at one end, and a Python backend, an MCP query service and a React curation app sat at the other, so I know what it takes to move data reliably from many sources to the agents that use it. A deterministic extraction pipeline I wrote for a high-volume source cut a projected $200,000 LLM budget to near-zero recurring cost. Kniit is a small startup, so I reported directly to the CTO and explained technical decisions to SAP domain experts who were not engineers, which is close to being the go-to person for a sales and marketing team.

On the infrastructure side, I containerised services with Docker and ran them on Kubernetes at Kniit and on Azure. At Covestro I deployed an agentic LangGraph application to AWS with CDK, Lambda and GitLab CI/CD, with a React front end and FastAPI backend. I have used GitLab pipelines rather than GitHub Actions, and my TypeScript experience is limited, so I would close those two gaps first.

GlassFlow's focus on giving agents correlated data and on tracing what they do in production matches problems I ran into myself: agents are only as good as the data under them, and without traces they are hard to debug. Helping shape that foundation in a small team is the kind of role I want.

I am based in Berlin, hold an EU Blue Card and can start on 15 November 2026. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
