Application for AI Software Engineer – Python

Dear Scalable Capital team,

I am writing to apply for the AI Software Engineer – Python position at Scalable Capital. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and most of that work has been what your posting describes: not training models from scratch, but building the Python services and agentic workflows that put LLMs to work in a real product.

At Kniit, a start-up working for the German energy sector, I am the only developer of an LLM-based knowledge-extraction service and report directly to the CTO. I built the extraction as a LangGraph workflow in which four agents work in parallel on regulatory and technical documents, and measured it against ground truth from SAP systems until precision and recall rose from 33% and 45% to 93% and 90%. I also learned where an LLM does not belong: for a second, high-volume source I wrote a deterministic pipeline instead, which cut a projected $200,000 LLM budget to near-zero recurring cost. The knowledge graph behind it is served to AI agents through an MCP service with millisecond-latency retrieval. Model calls go through LiteLLM, so the pipeline is not tied to a single provider.

On the infrastructure side, I deployed an agentic LangGraph application at Covestro with a FastAPI backend, Docker and AWS CDK, versioned in GitLab with CI/CD pipelines. For my Master's thesis I built serverless evaluation infrastructure on AWS with Lambda, SQS and DynamoDB that automatically tested the accuracy of the PrismaChat RAG assistant with RAGAS and PytrecEval. My infrastructure as code so far is AWS CDK rather than Terraform; the concepts carry over, and I am ready to work in Terraform.

Testing is the part I would care most about in a new work stream at a bank. LLM output changes with every prompt or model update, so I build evaluation against ground truth into the pipeline from the start, the same way I did at Kniit and in my thesis.

Your launch in August, which lets customers connect ChatGPT, Claude or Grok to their accounts while every trade still needs their confirmation, shows the balance I find interesting: AI that is useful inside a regulated product, with clear limits on what it can do. I would like to help build the services behind the next steps of that.

I will be based in Berlin (Munich works equally well), hold an EU Blue Card and can start on 15 November 2026. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
