Application for AI Evaluation Engineer

Dear Hiring Team,

I am writing to apply for the AI Evaluation Engineer position you are hiring for through Jobgether. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and in my current role and in my Master's thesis I owned the evaluation: deciding what correct means, setting up the ground truth, and measuring every change against it.

At Kniit, an early-stage startup serving the German energy sector, I am the sole developer of a knowledge-extraction pipeline and report directly to the CTO. The system is a multi-agent workflow in LangGraph, with extraction, relationship-analysis, consolidation and reflection agents running in parallel. Agents like that drift with every prompt edit, so I scored each iteration on precision and recall against a ground truth derived from SAP system data. That loop took the pipeline from 33%/45% to 93%/90%, and it is why I trusted the numbers.

Your posting asks for deterministic checks before LLM-as-a-judge. I made the same call in production, for extraction rather than evaluation: for a second, high-volume data source the plan was more LLM calls, projected at $200,000. I built a code-based pipeline instead, which brought the recurring cost close to zero and pushed accuracy toward 100%. The same logic applies to evaluation: schema, regex and similarity checks are cheap and stable, and a judge model should only see what they cannot decide.

Evaluation was also the subject of my Master's thesis at Covestro. I automated retrieval and generation evaluation for their RAG assistant with RAGAS and PytrecEval against answers written by chemists, ran it on AWS Lambda, SQS and DynamoDB built with CDK, and benchmarked multilingual embedding models on more than one million chunks of internal data. After the thesis I stayed on as an intern and shipped a LangGraph agent with a FastAPI backend, Postman API tests, Docker and GitLab CI/CD. My CI experience is in GitLab, and moving those pipelines to GitHub Actions is routine.

A founding role where one person designs the evaluation architecture is the kind of work I did at Kniit, and the part of AI engineering I want to focus on. Measuring non-deterministic systems honestly, with repeated runs and confidence intervals rather than a single lucky pass, is what I want to work on next.

I live in Essen, Germany, hold an EU Blue Card and can start on 15 November 2026. Overlapping three hours a day with US Central Time is no problem. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
