Application for Data Scientist - AI & Experimentation

Dear hiring team,

I am writing to apply for the Data Scientist - AI & Experimentation position on your partner's healthcare job-matching platform. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, from predictive models on real process data to LLM systems whose output quality I measured against ground truth.

My data science work started with forecasting. At Cognizant I built ARIMA, SARIMA, Prophet and LSTM models for EV load time series, and the LSTM reached 96% test accuracy on unseen data. In my data science internship at Covestro I trained Random Forest, XGBoost and LSTM models to predict prepolymer synthesis outcomes from sensor time series, engineered lag and rolling-window features, and compared the models against traditional empirical curve fitting. The result was an earlier warning for batches likely to miss specification, and a Streamlit dashboard where chemists could try parameter changes before running a batch.

On the LLM side, my Master's thesis at Covestro automated RAG evaluation with RAGAS and PytrecEval against chemist-provided ground truth and compared multilingual embedding models on more than one million chunks. At Kniit I am the sole developer of a multi-agent extraction system for the German energy sector; measured against a ground truth derived from SAP data, precision and recall rose from 33% and 45% to 93% and 90%. For a second, high-volume stream I built a deterministic pipeline instead, which cut a projected $200,000 LLM budget to near-zero recurring cost. In both roles I reported results directly to decision makers, the CTO at Kniit and chemists and business stakeholders at Covestro, and turned them into the next concrete step.

Two areas would be new to me in a job: running A/B tests and working with performance-marketing metrics such as CAC, ROAS and attribution. My statistics so far come from model evaluation, benchmarking against baselines and time-series modelling, and experiment design is where I would put my first weeks of work.

A matching platform for healthcare professionals is a good place for that mix of prediction, LLM features and experiments: every change to the matching shows up in the funnel, and it decides whether a nurse finds the right job and a clinic fills a shift.

I am based in Germany, can work remotely and come to the Berlin-Mitte office whenever needed, hold an EU Blue Card and can start on 15 November 2026. My German is at B1 level. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
