Application for Software Engineer – Agentic Systems (m/f/d)

Dear Hiring Team,

I am writing to apply for the Software Engineer – Agentic Systems position at Unzer. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently as the sole developer of an agentic system that runs in production. Using agents to automate parts of how software gets built is work I already do every day.

At Kniit I own a knowledge-extraction pipeline for the German energy sector, reporting to the CTO. Several LangGraph agents extract entities and relationships from regulatory documents, and I measured their output against a ground truth derived from SAP data. Precision and recall went from 33 % and 45 % to 93 % and 90 %. I also built an MCP query service that exposes the knowledge graph to Claude Code, and for one high-volume data stream I replaced the LLM with code-based extraction, which cut a projected $200,000 LLM budget to almost nothing.

I write and review code with coding agents daily: Claude Code with custom skills and agentic workflows, on a codebase with Python microservices, a React front end, MongoDB, Postgres and Docker on Azure. At Covestro I shipped a FastAPI backend with a LangGraph agent and a GitLab CI/CD pipeline to AWS, and worked with stakeholders on what the agent should decide. My backend work is in Python rather than Java, and I have not run payments systems, so those are the two areas where I would learn from the team.

Unzer's payment backbone has to be reliable, observable and secure, and the role puts AI on every stage from specification to operations. I want to build that and use the tools myself while doing it.

I am based in Berlin, hold an EU Blue Card and can start on 15 November 2026. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
