Application for AI Solutions Engineer (m/w/d) LLM, RAG & Automation, Saarbrücken

Dear Mr Thome,

I am writing to apply for the AI Solutions Engineer position in Saarbrücken that you are recruiting for. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently turning document-heavy business processes into working LLM and agent solutions.

At Kniit I am the sole developer of an agentic knowledge-extraction system for the German energy sector, reporting to the CTO. I took it from proof of concept to a system I have handed over: LangGraph agents for entity extraction, relationship analysis, consolidation and reflection read regulatory and technical documents, and measured against a ground truth derived from SAP system data they reached 93% precision and 90% recall, up from 33% and 45%. For a second, high-volume stream I built a deterministic, code-based pipeline instead of using an LLM, which cut a projected $200,000 LLM budget to near-zero recurring cost. The results are served through an MCP API and a React and Python app on Azure where domain experts approve changes.

The role's mix of business processes and engineering is what I did in my AI consulting internship at Covestro. I worked with business units to understand how they made decisions, advised where agentic AI could help, and then designed and deployed the application: a LangGraph agent with a FastAPI backend and React frontend, containerized with Docker and deployed to AWS with CDK and GitLab CI/CD. In my Master's thesis there I designed RAG pipelines and automated their evaluation with RAGAS and PytrecEval against chemist-provided ground truth, including a comparison of multilingual embedding models on more than one million chunks.

I have not yet integrated Microsoft 365, a DMS or production systems in a job, and my deployments so far were in the cloud rather than on premises. What I can bring to an on-premises evaluation is hands-on work with open-source models: I have fine-tuned open-source LLMs with QLoRA, and at Kniit I used LiteLLM as the model layer.

The focus on production processes and measurable benefit for the business units is close to my first Covestro internship, where I predicted prepolymer batch outcomes from sensor time-series and gave chemists a Streamlit dashboard to test parameter changes before running a batch. After a year on energy-sector documents at Kniit, an industrial client in the energy field is where I want to apply both.

I will be based in Saarbrücken, hold an EU Blue Card and can start on 15 November 2026. My German is at B1 level. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
