Application for Junior Data Engineer

Dear Hiring Team,

I am writing to apply for the Junior Data Engineer position at Grainset Data. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and most of that work was data engineering underneath: getting messy source data in, cleaning it and making sure the output can be trusted.

At Kniit I was the sole developer of a pipeline that ingests and processes high-volume documents from the German energy sector, working with SAP domain experts. I measured its output against ground truth derived from the SAP system, which took precision and recall from 33% and 45% to 93% and 90%. For a second source stream I replaced the LLM step with deterministic code, which cut a projected $200,000 LLM budget to near-zero running cost. That is the habit your role asks for: compare what the pipeline produced with the source records, and fix the difference.

My day-to-day tools are Python, SQL and Postgres, plus Git. At Covestro I worked with time-series process data in Pandas, building lag features and rolling windows, and I ran evaluations over more than one million data chunks. I also deployed services with Docker, and on AWS and Azure. I have not yet used dbt or Airflow in a job, and I am learning both.

I like that Grainset traces a reported figure back to the records behind it, and that the work here sits on SAP exports and shop data for companies in Germany. I would work German hours from home in Germany, with a daily overlap with Boston. I am based in Germany, hold an EU Blue Card and can start on 15 November 2026. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
