Application for Machine Learning Engineer

Dear Hiring Team,

I am writing to apply for the Machine Learning Engineer position at HDP. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and I like the idea of taking that work into software that accident insurers use for real cases every day.

At Kniit I am the sole developer of a knowledge-extraction pipeline for the German energy sector, from the first prototype to a working system that I handed over. I built multi-agent extraction with LangGraph for complex regulatory and technical documents and validated it against a ground truth derived from SAP system data; precision and recall rose from 33% and 45% to 93% and 90%. For a second, high-volume source I chose a deterministic, code-based approach instead of LLM calls, which cut a projected $200,000 LLM budget to near-zero recurring cost. Picking the right algorithm for the job, and sometimes no model at all, is the part of ML engineering I enjoy most.

Most of what I build runs as Python microservices. At Kniit that includes an MCP query service over the knowledge graph and the backend of a curation web app on Azure, with Docker and Kubernetes in the stack. At Covestro I built a FastAPI backend with REST APIs, tested it with Postman, containerised the whole application with Docker and deployed it to AWS with CDK and GitLab CI/CD. I work with Git every day, mostly together with Claude Code.

A good part of the job is explaining. At Kniit I report directly to the CTO and work through results with SAP domain experts; at Covestro I worked with business stakeholders to understand their decision workflows and explained how agentic AI could support them, and I built a Streamlit dashboard that let chemists test parameter changes before running real batches. Python is my main language, and I am ready to pick up Java on the job.

BesA caught my attention: the assistant that turns dictated or typed notes from prevention site visits into suggestions for defect reports, and the planned shared AI platform for language models with anonymisation and container-based delivery. Bringing ML into Cusa one microservice at a time, while sensitive case data stays protected, is the kind of work I want to do next.

I will be based in Alzey, hold an EU Blue Card and can start on 15 November 2026. My German is at B1 level and improving; my English is business fluent. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
