Application for Founding AI Engineer

Dear Alago team,

I am writing to apply for the Founding AI Engineer position at Alago. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, and for the past year I have worked on a problem close to your first one: getting agents to pull reliable structure out of long, messy technical documents.

At Kniit I am the sole developer of a knowledge-extraction system for the German energy sector, reporting to the CTO. The harness runs four LangGraph agents in parallel (entity extraction, relationship analysis, consolidation and reflection) over regulatory and technical documents. I measured it against a ground truth derived from SAP system data, and precision and recall went from 33% and 45% to 93% and 90%. Not every stream needed an agent: for a second, high-volume source I wrote a deterministic, code-based pipeline instead, which cut a projected $200,000 LLM budget to near-zero recurring cost. Knowing when not to call a model is part of what I mean by reliability.

Your second problem, project memory, is also familiar ground. The output of my pipeline is a knowledge graph in Neo4j. I built an MCP query service that serves it with millisecond latency, and Expert Interface, a React and Python web app on Azure where domain experts review and approve changes to the graph. At Covestro I learned to start from how people actually make decisions: I worked through business stakeholders' decision workflows and advised where an agentic workflow could help before building it with LangGraph, FastAPI and React and deploying it to AWS. At Kniit I work the same way with SAP domain experts.

On evaluation, my Master's thesis automated RAG retrieval and generation scoring with RAGAS and PytrecEval against chemist-provided ground truth, including a benchmark of multilingual embedding models on more than one million chunks. I want to be direct about the stack: my frontend work is in React, and TypeScript, Next.js and Supabase would be new to me. I use Claude Code every day, and I would rather close that gap on your product than on a tutorial.

What draws me to Alago is your line that the model isn't the moat, the project memory is. Reconstructing why a decision was made from an autobahn protocol is a harder and more interesting problem than summarizing it, and I like that your software is already answering to live infrastructure programs.

I will be based in Munich and can work in the office three days a week. I hold an EU Blue Card, can start on 15 November 2026, and my German is at B1 level. Thank you for considering my application.

Kind regards,

Chandu Prasad Bhairapu
