Application for Artificial Intelligence Engineer

Dear Hiring Team,

I am writing to apply for the Artificial Intelligence Engineer position at Akelius Languages. I have a Master's in Artificial Intelligence and three years of experience building and deploying AI applications, most recently agent-based systems that have to stay accurate and affordable once real users depend on them.

At Kniit I was the sole developer of a multi-agent knowledge-extraction pipeline built with LangGraph, reporting to the CTO. Entity-extraction, relationship-analysis, consolidation and reflection agents run in parallel, and I measured them against a ground truth derived from SAP data: precision and recall went from 33

Cost and evaluation are where I have the most to show. For a second, high-volume data stream I replaced LLM calls with a deterministic pipeline and cut a projected $200,000 LLM budget to near-zero running cost. My Master's thesis at Covestro was on RAG evaluation: I automated generation and retrieval scoring with RAGAS and PytrecEval against ground truth from chemists. I am used to building test sets with the people who know the content, which is how I would work with your content team.

I would like to work at Akelius because the assistant you describe serves teachers, and your products reach people through non-governmental organizations that bring education to those in need. Starting with math and then extending to other subjects is a design problem I enjoy: a modular platform where each new skill is a tool, with answers checked against your own course material.

I am based in Berlin, hold an EU Blue Card, and can start on 15 November 2026. Thank you for considering my application. I would be glad to walk you through my work in a conversation.

Kind regards,

Chandu Prasad Bhairapu
